

Git Command	Description
<code>git init</code>	Initializes a new local Git repository in the current directory.
<code>git status</code>	Shows the current state of the working directory and the staging area.
<code>git add <file></code>	Adds specific files to the staging area, preparing them for a commit.
<code>git add .</code>	Adds all modified and new files in the current directory to the staging area.
<code>git commit -m "..."</code>	Saves the staged changes into the local repository history with a descriptive message.
<code>git branch <name></code>	Creates a new parallel branch for developing features without affecting the main code.
<code>git checkout <name></code>	Switches the working directory to the specified branch.
<code>git merge <branch></code>	Combines the code from the specified branch into the current active branch.

<code>git remote add origin</code>	Links your local repository to a remote server (like GitHub).
<code>git push -u origin main</code>	Uploads your local commits to the remote GitHub repository.
<code>git pull</code>	Downloads and integrates the latest changes from the remote repository to your local machine.
